

Unity/C# Developer with 2+ years of commercial experience working on the large-scale MMORPG Corepunk. Experienced in C# development, client-server architecture, tools development, system optimization, debugging, and asset integration. Focused on building scalable, maintainable, and reusable systems and working effectively with large production codebases. Please visit my website for gameplay videos and detailed visual examples of my work

City:
Dublin, Ireland

Education

Bachelor's Degree, Computer Science / Software Engineering, Faculty of Information Technology, Uzhhorod National University

Specialized Secondary Education, Engineer-Technologist, Natural and Humanities Vocational College, Uzhhorod National University

Languages

- English – Intermediate
- Ukrainian – Native
- Russian – Native

Experience

Unity Developer / Technical Artist

Corepunk (MMORPG) Mar 2024 – September 2026

Contributed to a large-scale, production-ready MMORPG, specializing in client-server architecture, scalable gameplay systems, and visual logic. Focused on writing clean, SOLID-compliant code to safely extend a mature codebase. Collaborated closely with cross-functional teams (Game/Level Design, VFX, SFX, Animation) to streamline development pipelines and deliver high-quality features.

Key Achievements & Responsibilities:

- **Combat & Ability Handlers (Core Contribution):** Engineered the client-side behavior logic for in-game abilities, single-handedly developing **~50% of all visual effect handlers** across the project. Ensured VFX/SFX integration and strict server synchronization for complex hero/NPC skills, buffs, skillshots, and impacts.
- **Dynamic Visual Logic:** Implemented advanced terrain-adaptive logic, allowing projectiles, trails, and attack VFX to dynamically align with complex surface slopes without clipping. Developed a modular hit-reaction system that automatically selects precise VFX/SFX based on weapon types, target materials, and critical hit states.
- **Gameplay Architecture:** Designed a modular equipment system for dynamic weapon positioning across various hero specializations. Built animation transition logic for smooth movement states (walk, run, sneak, stop, jump), and created reusable mechanics for weapon switching, teleportation, and destructible object interactions.
- **Pipeline Automation & Tools:** Significantly accelerated team workflows by developing automated 3D asset import scripts that auto-configure optimal shaders and generate database entries. Enhanced custom Game/Level Design editors and built a robust suite of in-game QA testing tools (e.g., hitbox visualization, god mode, time modifiers, free camera).
- **Optimization & Refactoring:** Eliminated critical performance bottlenecks through large-scale optimization of textures, materials, shaders, and visual effects. Safely refactored legacy systems and resolved complex client-side issues (animator states, container management, dynamic asset loading) in a live production environment.

Tech Stack

- Unity, C#
- OOP & SOLID
- Client-Server Architecture
- Gameplay Systems
- Optimization & Debugging
- Unity Editor Tools & Pipeline Automation
- 3D Math / Vector Algebra
- Machine Learning & AI

Design Patterns

- Observer, Factory, Builder,
- State, Command, Strategy,
- Decorator, Object Pool, Flyweight
- MVC, MVP, MVVM

Tools & Workflow

- Git, SVN, Jenkins
- Jira, Notion
- Rider, Visual Studio
- Profiler, Frame Debugger

Database

- MySQL
- SQLite
- MongoDB

Frameworks, Libraries & Packages

- ML.Agents
- Mirror
- Zenject
- Telegram.Bot
- Selenium
- Google AdMob
- uGUI
- DoTween

Indie Developer

2021 – 2024, 2026 – Present

Architected and developed multiple independent projects, demonstrating versatility across game mechanics, applied programming, and artificial intelligence:

- **Game Development & Prototyping:** Engineered diverse titles ranging from 2D platformers — implementing responsive character controllers and integrating complex animation assets — to full 3D multiplayer environments.
- **Artificial Intelligence:** Trained NPC behaviors with reinforcement learning using Unity ML-Agents.
- **Algorithmic Logic:** Developed a Sudoku game featuring a custom-built puzzle generation algorithm, which was successfully adapted for publication in a local print newspaper.
- **Tooling & Automation:** Created a widely adopted Telegram bot for university networks that processed natural-language queries to automate daily schedules and distribute online class links.

Key Projects

SquidGame | *3D Multiplayer Party Game*

Engineered a fast-paced 3D third-person multiplayer game where players compete in a series of deadly mini-games with varying mechanics.

- Implemented real-time client-server multiplayer functionality using Mirror networking, managing precise player synchronization and server authority.
- Developed full cross-platform compatibility, enabling online crossplay and synchronized lobbies between PC and mobile users.
- Designed a modular mini-game architecture and robust session management system to seamlessly handle transitions between distinct game modes (e.g., physics-based survival, memory challenges).
- Integrated ML-Agents to train AI-controlled NPCs for dynamic and unpredictable enemy behavior.
- Applied design patterns (Factory Method, Observer) to maintain clean, scalable code across different modules.

Joker Jump | *Mobile Arcade Game*

- Designed and developed a complete reaction-based 2D mobile arcade game from initial concept to full release on the Google Play Store.
- Engineered core gameplay loops, progressive difficulty scaling, a custom achievement system, and persistent local data storage for tracking player progression and high scores.
- Implemented comprehensive 12-language localization architectures to expand the global user base.
- Integrated the Google AdMob SDK for optimized ad monetization, analytics, and performance tracking.
